all aspects of CDI pertaining to LTCF settings, including epidemiology, diagnosis, prevention, management and the unique challenges faced by LTCFs with regards to the CDI problem. The book begins by introducing the topic as it relates to aging patients before delving into the various aspects of CDI management. Topics include infection control and prevention, treatment of CDI, and the establishment of antibiotic stewardship programs to reduce inappropriate antibiotic use and reduce CDI rates. The book also features a chapter on probiotics for the prevention of CDI and new strategies to monitor environmental cleaning practices of CDI patient rooms that do not appear in any other resource. Clostridium Difficile Infection in Long-Term Care Facilities is an excellent resource for geriatricians, infectious diseases specialists, long-term care administrators, nurses, pharmacists, researchers, and all clinicians working with infections in long-term care

Healthcare-Associated Infections in Children J. Chase McNeil 2018-10-30 With advances in technology and medical science, children with previously untreatable and often fatal conditions, such as congenital heart disease,

Guide To The Management Of Infectious Disease Monographs In Family Medicine

extreme prematurity and pediatric malignancy, are living longer. While this is a tremendous achievement, pediatric providers are now more commonly facing challenges in these medical complex children both as a consequence of their underlying disease and the delivery of medical care. The term healthcare-associated infections (HAIs) encompass both infections that occur in the hospital and those that occur as a consequence of healthcare exposure and medical complexity in the outpatient setting. HAIs are associated with substantial morbidity and mortality for the individual patient as well as seriously taxing the healthcare system as a whole. In studies from the early 2000s, over 11% of all children in pediatric intensive care units develop HAIs and this figure increases substantially if neonatal intensive care units are considered. While progress has been made in decreasing the rates of HAI in the hospital, these infections remain a major

burden on the medical system. In a study published in 2013, the annual estimated costs of the five most common HAIs in the United States totaled \$9.8 billion. An estimated 648,000 patients developed HAIs in hospitals within the US in 2011 and children with healthcare-associated bloodstream infection have a greater than three-fold increased risk of death. While a number of texts discuss HAIs in the broader context of infectious diseases or pediatric infectious diseases (such as Mandell's Principles and Practice of Infectious Diseases or Long and Pickering's Principles and Practice of Pediatric Infectious Diseases) no single text specifically focuses on the epidemiology, diagnosis and management of HAI in children. Many infectious diseases texts are organized based on the microbiology of infection and from this starting point then discussing the clinical syndromes associated with the organism of interest. For instance, a chapter on *Staphylococcus aureus* may

Guide To The Management Of Infectious Disease Monographs In Family Medicine

contain a brief discussion of the role of *S. aureus* in surgical site infections in the wider context of all staphylococcal disease. For clinicians caring for children at the bedside, however, the clinical syndrome is typically appreciated and intervention necessary prior to organism identification. We propose a text that details both the general principles involved in HAIs and infection prevention but also provides a problem oriented approach. Such a text would be of interest to intensivists, neonatologists, hospitalists, oncologists, infection preventionists and infectious diseases specialists. The proposed text will be divided into three principle sections: 1) Basic Principles of Infection Control and Prevention, 2) Major Infectious Syndromes and 3) Infections in Vulnerable Hosts. Chapters in the Major Infectious Syndromes section will include discussion of the epidemiology, microbiology, clinical features, diagnosis, medical management (or surgical management as

appropriate) and prevention of the disease entity of interest. Chapters will seek to be evidenced based as much as possible drawing from the published medical literature as well as from clinical practice guidelines (such as those from the Infectious Diseases Society of America) when applicable. We intend to include tables, figures and algorithms as appropriate to assist clinicians in the evaluation and management of these often complex patients. Finally, we intend to invite authors to participate in this project from across a number of medical specialties including infectious diseases, infection control, critical care, oncology and surgery to provide a multidisciplinary understanding of disease. It is our intent to have many chapters be co-written by individuals in different subspecialties; for instance, a chapter on ventilator-associated pneumonia may be co-written by both infectious disease and critical care medicine specialists. Such a

Guide To The Management Of Infectious Disease Monographs In Family Medicine

unique text has the potential to provide important guidance for clinicians caring for these often fragile children.
