Resolving Erroneous Reports in Toxicology and Therapeutic Drug Monitoring Amitava Dasgupta 2012-07-02 The tools for detecting false positives, false negatives, and interference in interactions when testing and monitoring therapeutic drug use. For physicians monitoring a patient's progress, efficacy of treatment is often linked to a patient's response to medication. Determining whether a patient is taking the prescribed amount, the drug or dosage is effective, or the prescribed medication is interacting with other drugs can be determined through drug testing. Written as a guide for toxicologists, chemists, and health professionals involved in patient care, *Resolving Erroneous Reports in Toxicology and Therapeutic Drug Monitoring* provides an up-to-date introduction to the tests and methodologies used in a toxicology lab as well as the sources of testing error that can lead to false positives, false negatives, and unreliable conclusions of drug abuse or under use. Covering a host of common therapeutic drugs as well as specific types of interference in immunoassays used in drug testing, the book details a number of possible testing scenarios and problems as well as solutions: False positive results in immunoassays for drugs in abuse testing. Interferences in immunoassays used for monitoring anticonvulsants, tricyclic antidepressants, and digoxin. False positive alcohol tests using breath analyzers and automated analyzers. When a toxicology report is negative in a suspected overdose patient: the world of designer drugs. Effects of drug-herb interactions on therapeutic drug monitoring. Pharmacogenomics and the general principles of genetic analysis. Approaches for eliminating interference/discordant specimen in therapeutic drug monitoring and drugs in abuse testing. What to do in case there is no readily available method for testing.
